Akuleti Sravani

+07384777980 | akuletisravani2048@gmail.com

Education

University of Hertfordshire — Little Illford Lane, UK

Masters in Cybersecurity — *Sep 2024 – Oct 2026*

Technical Skills

Languages: HTML, CSS, Java, Python
Databases: MySQL, SQL

Networking Skills

- TCP/IP, DNS
- DHCP, VPN
- Firewalls, Network Protocols
- IDS/IPS Systems
- Routing and Switching

Projects

AI-Based Detection of Malware in IoT Firmware Using Static Analysis and Machine Learning

- This project, "AI-Based Detection of Malware in IoT Firmware Using Static Analysis and Machine Learning," focuses on improving the security of Internet of Things (IoT) devices.
- The system automatically analyses IoT firmware without executing it, making the process safer. Binwalk is used to unpack firmware, while Radare2 extracts features such as opcode sequences, entropy, strings, and imported functions. These features are then used to train XGBoost and CNN models to classify firmware as benign or malicious.
- The reported results show that XGBoost achieved 100% accuracy, while the CNN achieved 99.68% accuracy. Overall, the project demonstrates that combining static firmware analysis with machine learning can provide an effective and scalable approach for detecting malware in IoT firmware.

Online Blood Donation Management System

An Online Blood Donation Management System is a web-based application designed to manage blood donors, blood stocks, and blood requests efficiently. It allows donors to register, provide their blood group and availability, and receive donation information. Hospitals or patients can search for suitable blood groups and submit blood requests. The system maintains updated records of donors, blood units, and requests, reducing manual paperwork. It helps connect blood donors with people who need blood quickly and efficiently. Overall, the project aims to make blood donation management faster, organised, accessible, and reliable.
